## Introduction

Charlotte's residential communities have been the focus of considerable public investment and public policy attention during the past several years. With the publication of the City Within A City (CWAC) Neighborhood Assessment in 1993, inner city community residents, policy makers and neighborhood leaders were able to take a closer look at the issues that would need to be addressed in order to sustain neighborhood vitality.

In 1997, the Neighborhood Assessment was followed by the CWAC Neighborhood Quality of Life Index. The Index evaluated the quality of life in each of the 73 CWAC neighborhoods through the analysis of multiple variables. These variables were aggregated into social, physical, crime and economic dimensions that, in turn, were combined to create a quality of life index or score for each neighborhood. These data provided a baseline of information that permit a reexamination of neighborhood level quality of life in the future. Indeed, the index study was intended to serve as a benchmark, the first step in an ongoing program to monitor progress toward goals of sustaining and renewing the neighborhoods of the City Within A City.

In July 1998, the Charlotte Neighborhood Development and the Charlotte-Mecklenburg Planning Commission contracted with UNC Charlotte to expand and update the earlier initiatives. The 2000 Charlotte Neighborhood Quality of Life Study was the product of this work. This research process expanded the geographical scope of the earlier inner city analysis. It evaluated the quality of life in 173 neighborhood statistical areas (NSAs) in the city and in the Charlotte sphere of influence. The 2000 study constructed an index measurement using 19 locally based variables measuring neighborhood social, physical, and economic conditions. Finally, this study provided a citywide baseline for measuring cumulative and individual changes in NSAs in the future.

This report, Charlotte Neighborhood Quality of Life 2002, follows closely the framework and format of the most recent quality of life study. The composition of variables has changed slightly in order to strengthen the rigor of the statistical analysis. However, the baseline neighborhood scale quality of life framework developed in 2000 remain comparable to the 2002 data. As in earlier studies, this research converts the individual statistical scores into three neighborhood-ranking categories "stable," "threatened," and "fragile". In this way, holistic neighborhood change can be examined for positive and negative shifts.

Included, as Appendix A, is a neighborhood profile for each NSA. This profile document provides an individualized statistical summary for all 173 NSAs. The profile includes quality of life rankings, background statistics, and the individual descriptive data for each of the 19 variables used in the quality of life analysis along with their comparable citywide data.

## Defining Quality of Life

Quality of Life can mean many things to different people. Some would argue that in order for a community to enjoy a good quality of life, residents should feel safe from crime, live in affordable and high quality housing, and should have access to education and employment. Indeed, these are basic expectations for a community. They transcend economic status, age, race, household composition, or any other demographic characteristic.

There are, however, other more subjective ideas of what makes a neighborhood an enjoyable place to live. These ideas often revolve around the character of a neighborhood. Is it clean? What do the houses look like?

It includes economic vitality. Are there shops in the neighborhood? Is transportation available for those without automobiles? And finally, the physical and civic health of the residents is important. Are there opportunities for civic involvement? How well are children doing in school?

Increasingly cities and counties across the U.S. are developing locally based measures to assess quality of life. Publications such as the *Providence Neighborhood Fact Book*, *The Quality of Life in Pasadena*, *Jacksonville Quality-of-Life Report*, *Sustainable Indicators in Seattle*, and *Oregon Benchmarks* are commonly cited prototypes. Together, these studies have assessed over 200 indicators of quality of life. They have looked at quality of life at the neighborhood, city, county and metropolitan level. Some have collected unique measures of quality of life, reflective of local environmental, social and economic conditions. Most communities have, however, relied on data from the U.S. Census.

The idea of “quality of life” is a multi-faceted concept that seeks to include a wide variety of issues under one umbrella. This report defines neighborhood quality of life as a nexus where social well being, physical characteristics, crime, and economic vitality are all considered. In all, 19 variables make up this quality of life composite (Table 1). A detailed description of each variable is contained in Appendix B, Neighborhood Profiles: User Guide. The selection of the individual variables was made following extensive discussion and consultations with the sponsoring organizations and staff from the cooperating city and county partners.

**Table 1. Charlotte Neighborhood Quality of Life Variables**

***Social Dimension***

Percent of Persons over Age 64  
Average Kindergarten Score  
Dropout Rate  
Percent of Children Passing Competency Exams  
Percent of Births to Adolescents  
Youth Opportunity Index

***Physical Dimension***

Appearance Index  
Percent Substandard Housing  
Percent Homeowners  
Projected Infrastructure Improvement Costs  
Percent of Persons with Access to Public Transportation  
Percent of Persons with Access to Basic Retail  
Pedestrian Friendliness Index

***Crime Dimension***

Violent Crime Rate  
Juvenile Arrest Rate  
Property Crime Rate  
Crime Hot Spots

***Economic Dimension***

Percent of Persons Receiving Food Stamps  
Percent Change in Income

## Methods

The findings reported in this study were based on an analysis of 19 variables collected for 173 Neighborhood Statistical Areas (NSAs). Within this framework, the 19 variables were classified into four groups or dimensions: Social, Physical, Crime, and Economic. The data were standardized prior to calculating quality of life indices. The standardization was done by computing the mean value for the neighborhoods on each of the 19 variables. The mean for each variable was given a value of zero and each neighborhood score was expressed in terms of the number of standard deviations above or below the mean (*Z* scores). This procedure converts all variables to the same unit and allows neighborhood scores to be added to derive an overall or composite score based on multiple variables. Some of the variables used in the analysis were inverse measures of the quality of life, i.e., a high value indicated a low quality of life condition. The signs of the *Z* scores for these variables were reversed before summing scores for several variables to derive an overall or cumulative score for the quality of life.

Subsequently, quality of life scores were calculated for individual NSAs for each of the four groups of variables. A composite score was determined for each neighborhood on each of the four dimensions (Social, Crime, Physical, and Economic) by summing the neighborhood *Z* scores on the individual variables comprising the dimension. Once the composite *Z* scores were determined on a dimension for the neighborhoods, these scores were standardized again, i.e. each neighborhood's score was expressed in terms of the number of standard deviation units above or below the mean. Thus, a high positive score indicated a high quality of life condition in the neighborhood.

Finally, an overall or composite quality of life index for each of the neighborhoods was determined by summing each neighborhood's quality of life scores for the four dimensions. In computing the overall index, the four dimensions were weighted in the following manner: Social, 30%; Crime, 30%; Physical, 30%; and Economic, 10%. Once a weighted composite score was determined for each neighborhood, these scores were again standardized by setting the mean value to zero and expressing each neighborhood's score in standard deviation units above or below the mean. Large positive scores indicate a high quality of life while large negative scores reveal a low quality of life.

In addition to the citywide analysis using the 173 NSAs, the same procedure was used to determine quality of life scores for the CWAC neighborhoods as a separate group. This analysis is presented in Appendix D, CWAC Analysis.

A companion document, **Charlotte Neighborhood Quality of Life Technical Report 2002**, contains the complete set of data for all individual variables as well as maps displaying the distribution of variables across NSAs.

## Geographic Units

The quality of life assessment is carried out for 173 NSAs. This geographical coverage greatly expands the scope of earlier studies (Figure 1). The neighborhood and NSAs used for this study were delineated by the Charlotte-Mecklenburg Planning Commission. They have been used by Planning Commission and other city and county staff for a variety of community-based initiatives. The CWAC geography is structured around 73 inner city neighborhoods, whose boundaries roughly follow 1990 U.S. Census block group and block boundaries (Figure 2). Table 2 lists the neighborhood name and NSA number.

The NSA boundaries were developed by Planning Commission staff to delineate more suburban residential areas (Figure 3). Again, 1990 U.S. Census block group and block boundaries were utilized as guides. There are eight non-residential NSAs not included in this research framework. Central City Charlotte is also not included in this study.

## Stable, Threatened and Fragile Neighborhoods

A comprehensive assessment of quality of life in Charlotte's neighborhoods was completed using 19 social, physical, crime, and economic variables. Four dimensions of quality of life were defined. These dimensions were further aggregated into an overall quality of life index. Based upon a cumulative score on the quality of life index, NSAs were grouped into three categories: stable, threatened and fragile.

Grouping data into categories is a valuable tool to create a general standard that can convey the idea of quality of life in individual communities. Moreover, it permits a comparison of the quality of life between NSAs as well as comparison within the entire city. However, this general categorization should only be used to recognize the generic level of need in a community. Each NSA is unique, and its score on the individual dimensions and possibly individual indicators should be recognized as critical to assessing the specific conditions and needs of a neighborhood.

**Stable:** Stable NSAs are those that have few social problems, low rates of crime, few infrastructure and housing needs, and high levels of economic vitality. These are neighborhoods that score highly on the Social, Physical, Crime, and Economic dimensions.

**Threatened:** Threatened NSAs are those that score relatively high on most of the dimensions but may have a significant problem on one or more of the dimensions.

**Fragile:** Fragile NSAs generally have low to moderate scores on all four dimensions. A fragile neighborhood has a lower quality of life and is “at risk” on multiple dimensions.

This study looks at the very broad issues in each community as well as detailed data. When assessing individual NSA needs, it is essential to look at both the general level of quality of life and the particular circumstances that cause a rating. The specific variable values that are used to compile the three part groupings are contained in the **Charlotte Neighborhood Quality of Life Technical Report 2002**.

## Citywide Quality of Life Results

Stable NSAs have a high quality of life. Threatened NSAs have a moderate quality of life. In fragile NSAs, the quality of life is marginal. Figure 4 and companion Table 3 identify individual neighborhood categories and the distribution of rankings across all NSAs. Appendix A, Neighborhood Profiles, presents detailed analytical information and profile data for each NSA.

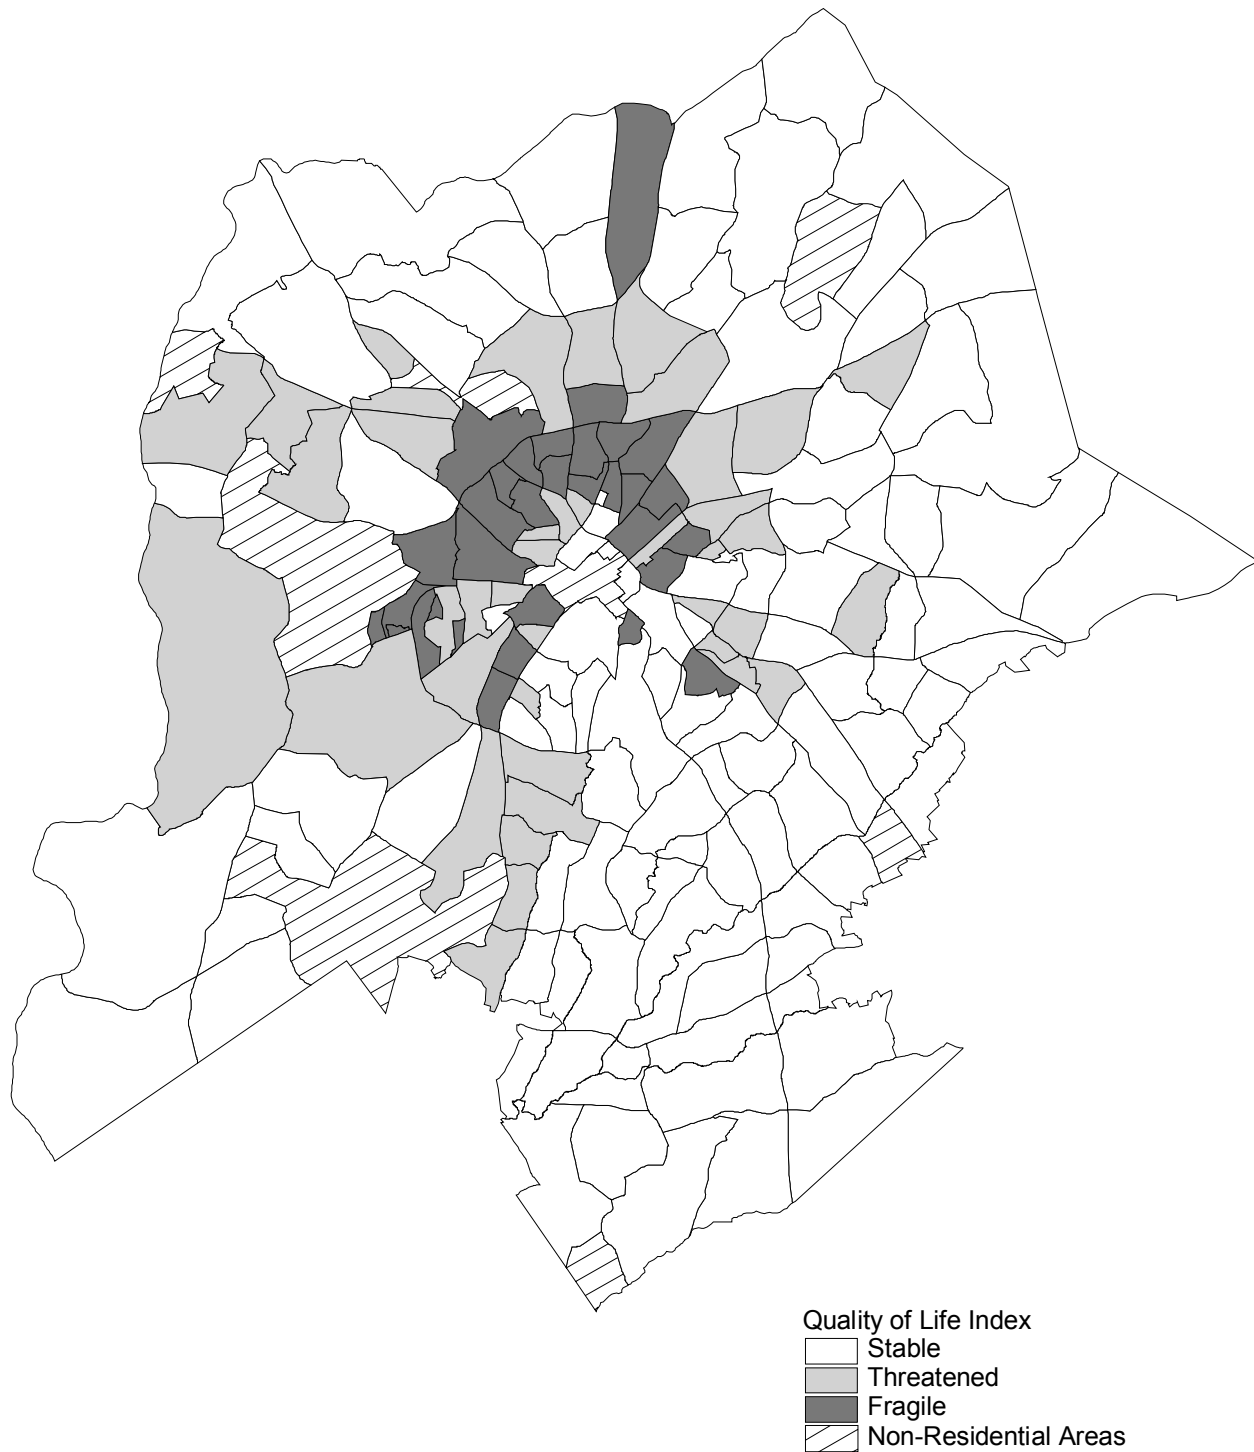

The quality of life experienced by residents in a particular area can vary from person to person. Quantifying a concept as subjective as “quality of life” is a complicated task. However, in order to assess all aspects of what makes a community a desirable, safe, and socially healthy place to live, it is necessary to reduce the complex idea of “quality of life” to a manageable set of measurable information. This information can, in turn, be used to improve or maintain neighborhoods in Charlotte.

For this study, it was determined that a strong, healthy neighborhood or NSA has few social needs, low crime rates, low levels of physical deterioration, and low levels of economic stress. These are important aspects of any healthy community. However, these qualities do not occur independently. For example, neighborhoods with high crime rates typically have relatively high rates of social need or physical deterioration. This type of situation illustrates the need to address quality of life from many different perspectives, utilizing the talents and resources of many people and organizations in a cooperative effort with neighborhood residents.

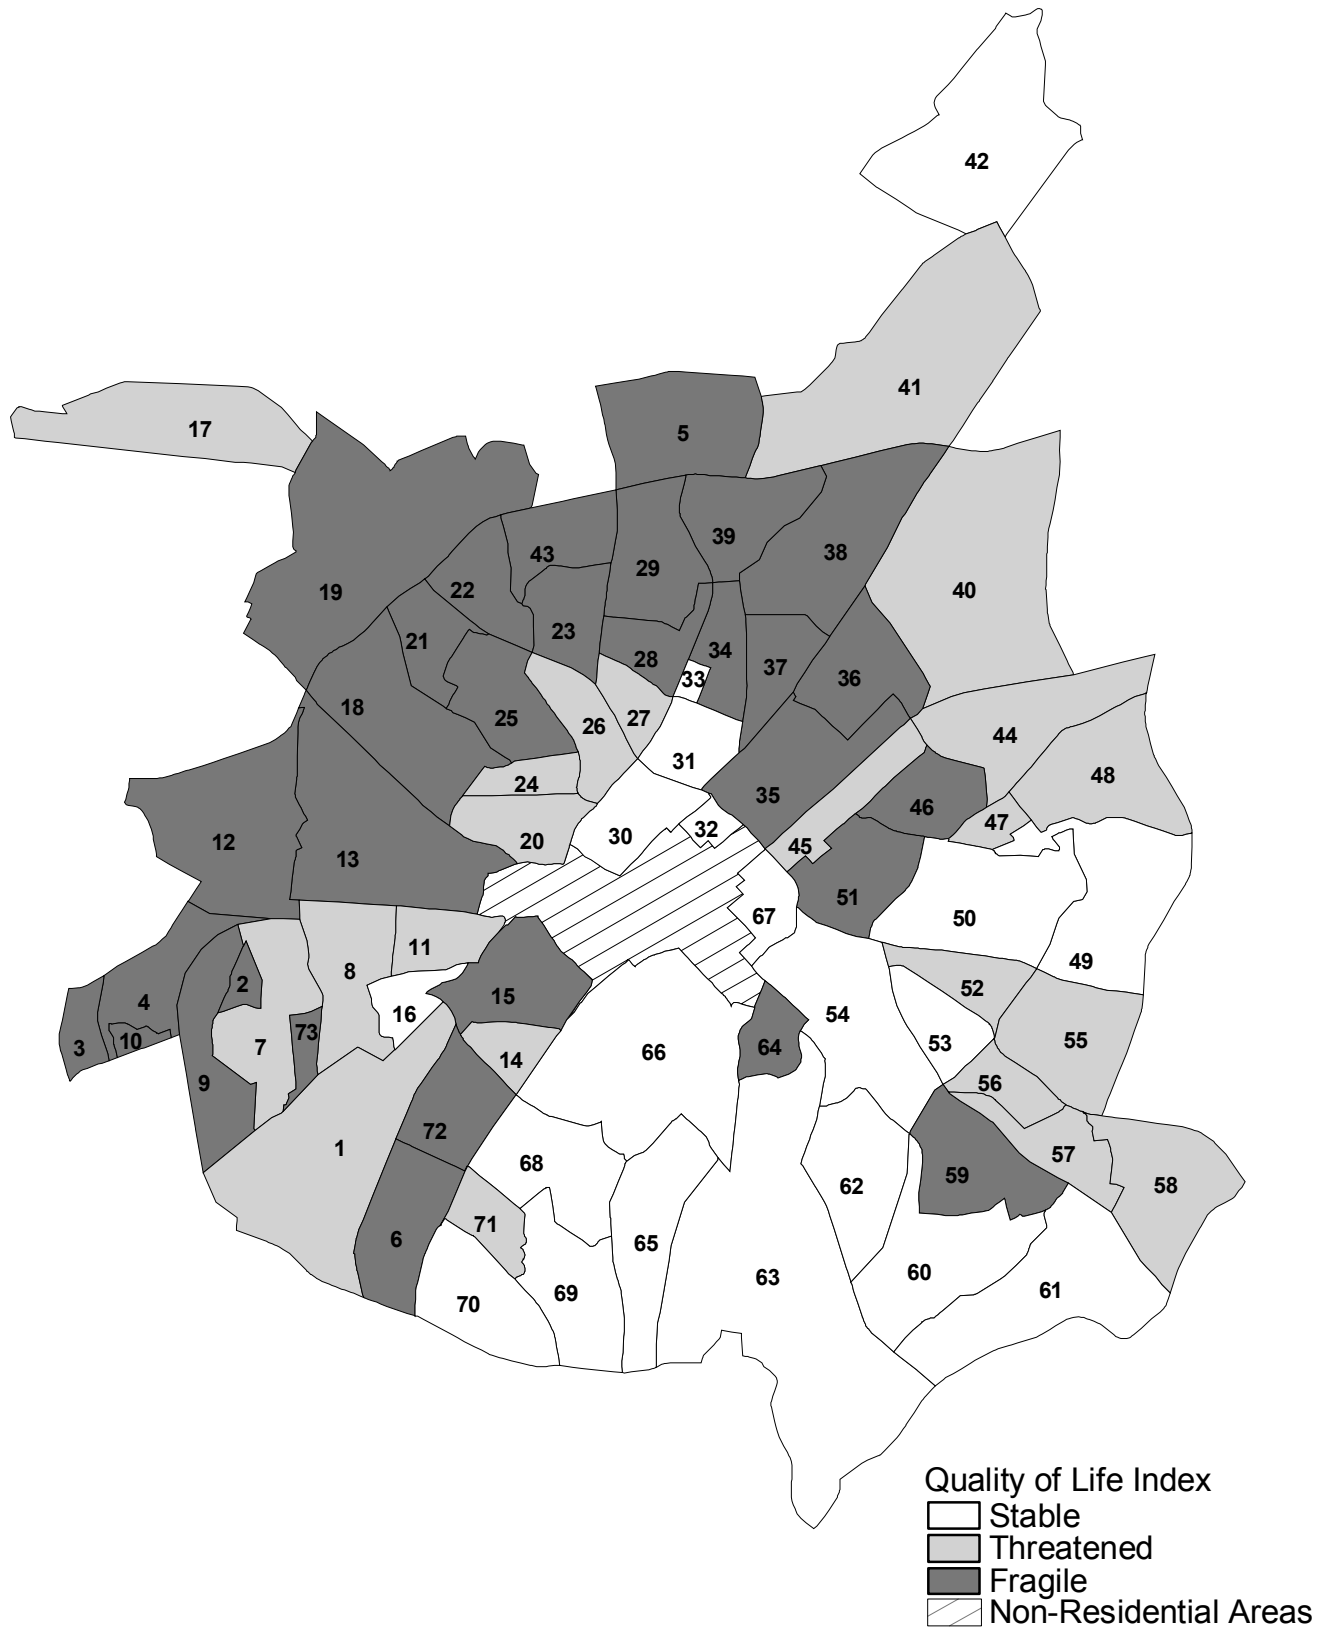

Strong, healthy residential communities throughout a jurisdiction are the backbone of a successful city. Acknowledging the interrelated issues of quality of life is the first step in creating a program to routinely assess progress towards healthy neighborhoods and focus efforts on strengthening the residential structure.

Of the 173 NSAs, 100 were classified as stable, 41 were classified as threatened and 32 were classified as fragile. Detailed mapped results are presented on Figures 5 and 6. Table 3 contains a listing of NSAs in each category. Citywide, stable neighborhoods were concentrated in the southeast, northeast and peripheral west areas of Charlotte and the Sphere of Influence. Threatened neighborhoods were generally scattered in pockets in the west, southwest, and north portions of Charlotte. Fragile neighborhoods lined the Interstate-77 corridor and were concentrated in the west, northeast and north sections of inner city Charlotte.

## **Four Dimensions of Quality of Life**

Measuring the quality of life in a community is a very complex undertaking. Charlotte's neighborhoods are diverse and continually changing. Because individual NSAs have such varied circumstances, it is necessary to assess at their strengths and weaknesses from many points of view in order to better understand the individual characteristics of each community. Recognizing that each place is unique, this study looks at each NSA from 19 different perspectives (variables). These perspectives are then aggregated into four dimensions. These include social, physical, crime, and economic dimensions. The analytical findings for each dimension are presented in the following sections.

## Social Dimension

### Overview

The social well being of a neighborhood is dependent upon many interconnected issues. Neighborhoods with a desirable quality of life are economically and socially diverse and self-sufficient. They have healthy populations with a mix of older and younger residents, are served by strong public schools, and have residents that are involved in their community. These neighborhoods provide strong role models for youth and opportunities for young people to be involved in a variety of after-school activities. The social vitality of a neighborhood is one dimension of a comprehensive assessment of neighborhood quality of life.

### Results

Stable NSAs have few social needs. Threatened NSAs exhibit moderate levels of social stress and fragile NSAs have high rates of social distress. Individual NSA scores, as well as the geographical pattern of the results are presented in Figures 7 and 8 and Table 4.

Of the 173 NSAs, 91 were classified as stable, 52 were classified as threatened and 30 were classified as fragile on the social dimension. In broad terms, most suburban NSAs are classified as stable. Conversely, the concentrations of fragile and threatened NSAs are uniformly focused in north and west side CWAC neighborhoods. The one notable exception is a swath of threatened NSAs that extends along Independence Boulevard from the inner city into the east side of Charlotte.

In reviewing and interpreting the social dimension, it is critical to remember that individual NSA scores reflect unique differences between NSAs as well as general patterns of problems within communities. Consequently, it is important to acknowledge that variables are often related and do not act with complete independence. For example, low scores on competency exams are generally coupled with high rates of births to adolescents and low levels of youth opportunity. Thus, related variables exhibiting similar scores signal a need to target specific populations or problem areas in an NSA.

Social need is only one component of neighborhood quality of life. Nevertheless, the social categorization helps isolate communities that have the greatest needs. Individual variable scores help to pinpoint specific problems and identify which organizations are best qualified to address those deficiencies. By tracking specific scores over time, progress towards established goals can be assessed and communities strengthened.

## Crime Dimension

### Overview

Crime rates play an integral role in the overall quality of life in an area. High rates of crime create an unstable and undesirable living environment. The crime dimension measures various crime rates in each NSA and compares them to the rates for Charlotte. By comparing crime rates between small geographic areas and the larger city area, it is easier to assess whether the criminal activity in a neighborhood is above or below average for the city. In this way, NSAs with crime conditions affecting quality of life can be identified.

### Results

Stable NSAs have low levels of crime. Threatened NSAs exhibit average level of crime. Fragile NSAs have high crime rates. Figures 9 and 10 and Table 5 present the crime dimension findings.

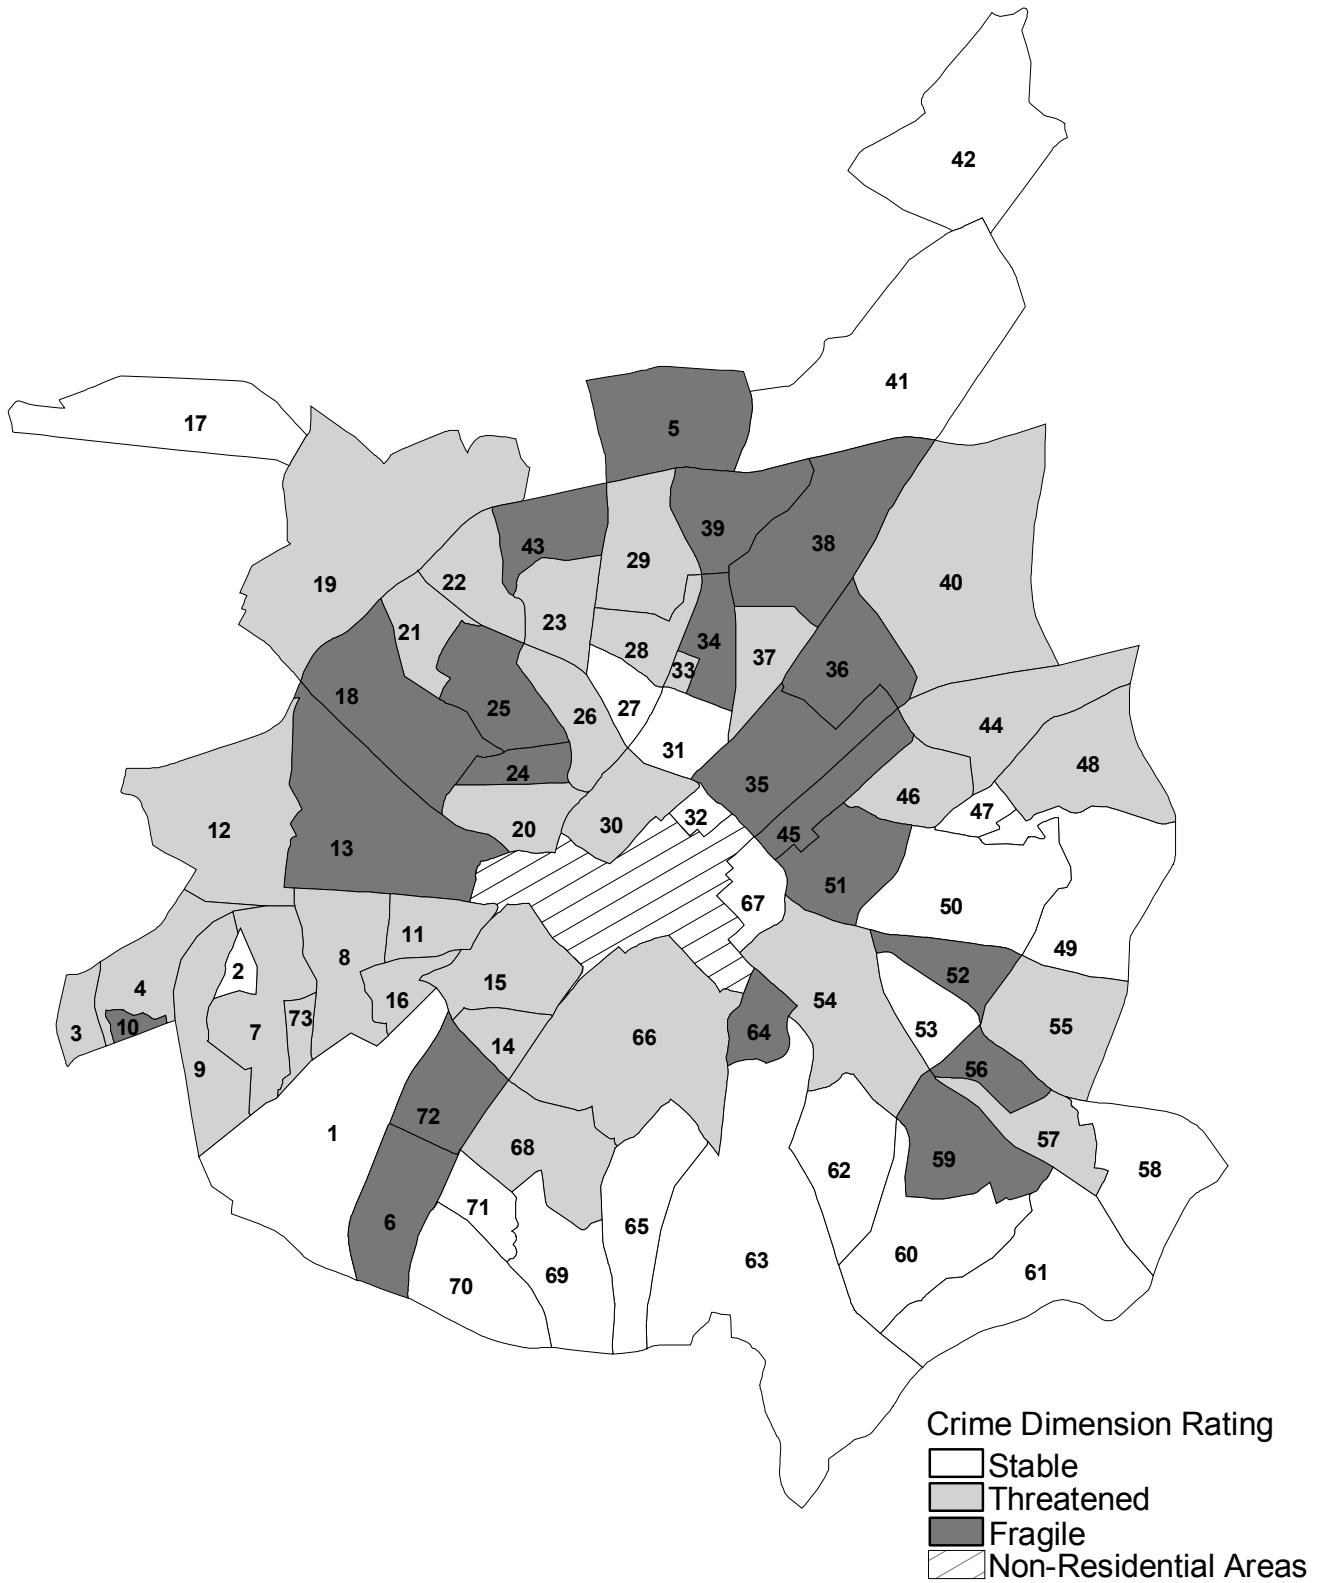

Of the 173 NSAs, 103 were classified as stable, 49 were classified as threatened and 21 were classified as fragile on the crime dimension. Crime is a geographically focused problem. Fragile NSAs are spatially concentrated in northern and western inner city neighborhoods of CWAC and in adjoining NSAs. Threatened NSAs exhibit the same pattern. Communities afflicted with high rates of criminal activity tend to be woven together rather than isolated from each other. Outside of these threatened and fragile NSAs most Charlotte NSAs are characterized as stable.

In reviewing and interpreting the crime dimension, it is critical to remember that each NSA score reflects unique differences between neighborhoods as well as the social and economic context within neighborhoods. Levels of crime are sometimes related to the physical or social conditions in a neighborhood. Areas characterized by vacant lots and abandoned buildings provide ideal locations for criminal activity.

Crime is only one component of neighborhood quality of life. Nevertheless, the crime categorization helps isolate NSAs that have the greatest needs in this area. Monitoring and tracking crime levels over time can assess progress towards measurable goals. Also, areas that have persistently high levels of crime can be targeted for special efforts.

## Physical Dimension

### Overview

The physical appearance of a community is a valuable indicator of the level of social and economic distress experienced by residents. Deteriorated housing stock and vacant or abandoned businesses indicate a neighborhood in trouble or at risk. Conversely, well-maintained public areas and infrastructure, affordable and attractive housing and accessibility to basic retail establishments indicate a low level of stress—a desirable and safe place to live. Lack of maintenance of neighborhood structures weakens the social fabric of a neighborhood. An abandoned, boarded-up home invites criminal activity, jeopardizing resident safety and scarring the appearance of the neighborhood.

### Results

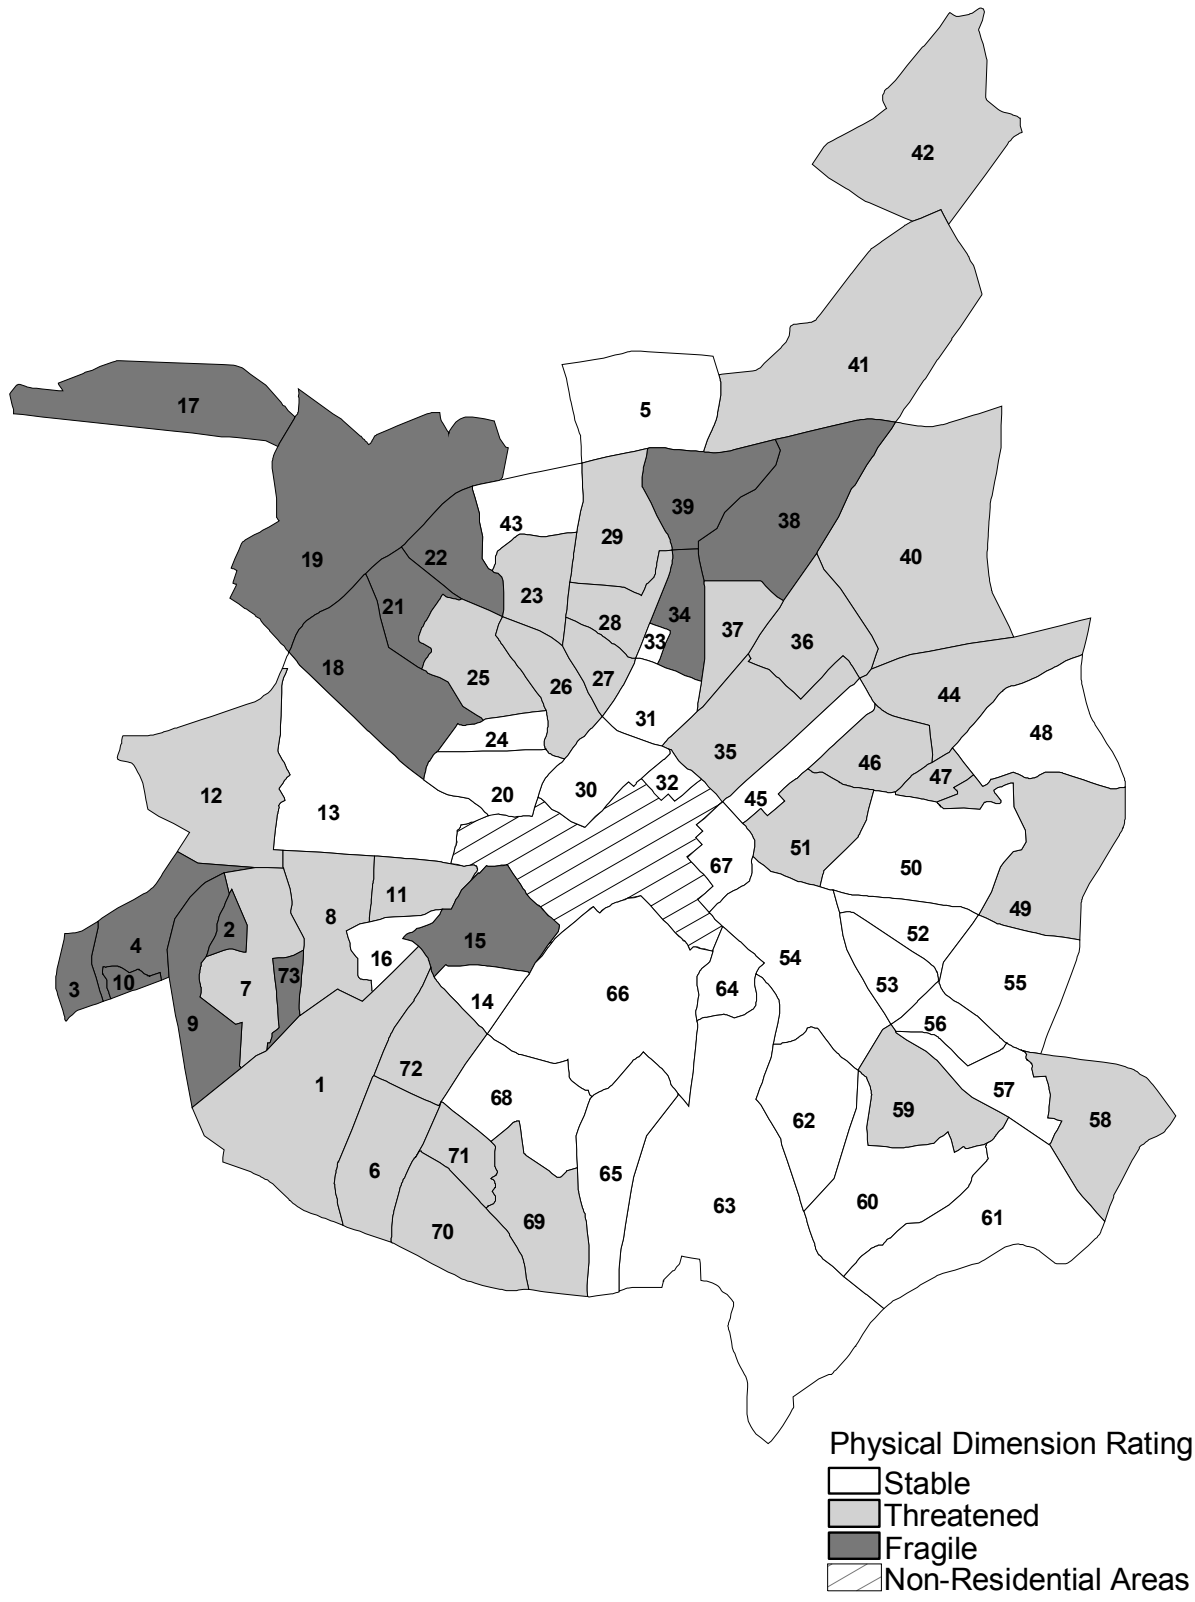

Stable NSAs have few physical needs. Threatened NSAs exhibit moderate levels of physical decline. Fragile NSAs have high rates of physical deterioration. Figures 10 and 11 and Table 5 contain the results of the physical dimension analysis.

Of the 173 NSAs, 95 were classified as stable, 60 were classified as threatened and 18 were classified as fragile. Physically stable neighborhoods were found throughout but were specifically concentrated in suburban areas. The largest concentration of stable NSAs are found in southeast Charlotte and northeast Charlotte. Threatened NSAs are clustered in north and west Charlotte, with a disproportionate number in the older inner city neighborhoods. Fragile NSAs are almost exclusively located in inner city areas of Charlotte.

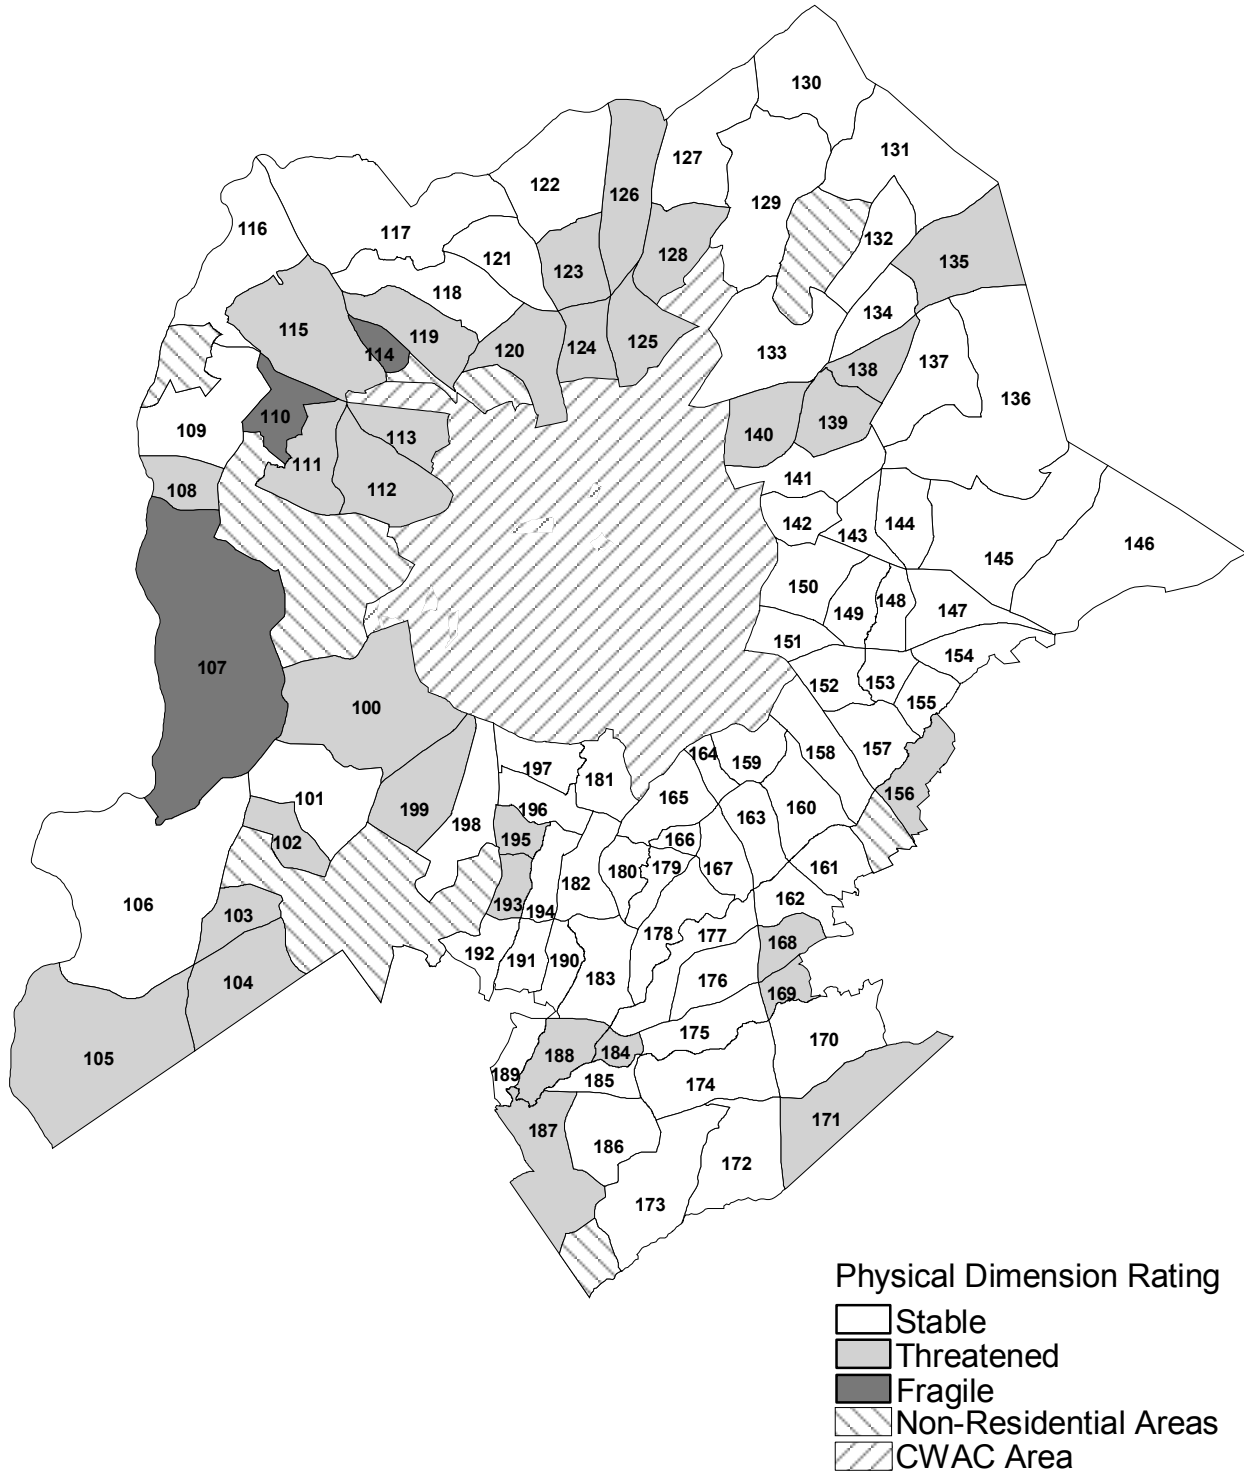

Physical Dimension scores represent a composite assessment of the quality of the physical attributes of a community. The physical condition of buildings, lots and businesses sets the tone of the NSA. A well-kept community gives a sense of security to those who live in or visit a neighborhood.

The physical integrity of a neighborhood is important in maintaining the quality of life of residents. All citizens benefit from clean, safe environments. Therefore, assessing the overall level of physical stress in a neighborhood is a necessary prerequisite to organizing strategic methods for improving conditions.

## Economic Dimension

### Overview

The economic vitality and the economic characteristics of a neighborhood are the most commonly cited quality of life indicators. Often indicators look at household income measures. As a consequence, the evaluation of economic vitality can easily become biased towards affluent neighborhoods. This reports seeks to look at a different measure of economic vitality, which is less biased toward higher income neighborhoods. In this study, economic vitality is assessed using the change in median NSA income and the percentage of persons receiving food stamps.

### Results

Stable NSAs have high rates of income change and the lowest rates of food stamp qualification. Threatened neighborhoods have modest levels of change and higher rates of food stamps. Finally, fragile neighborhoods have low rates of income change or real declines and the highest rates of food stamp participation. Figures 13 and 14 and Table 7 contain the economic dimension findings.

Of the 173 NSAs, 89 were classified as stable, 63 were classified as threatened, and 21 were classified as fragile. Geographically, stable NSAs are concentrated in the southeastern quadrant of the inner city and suburban edge, University area, and east and west suburban NSAs. Threatened NSAs are concentrated around the urban core, especially in north and west Charlotte NSAs. Fragile NSAs predominate in the northern and western inner city areas.

Growing income levels in all parts of the community sustain the prosperity and quality of life of all residents of Charlotte. Early detection of potential economic instability can help city officials and residents to work together to strengthen neighborhood education and job-training resources. These indicators will help city officials to take a proactive approach to creating and maintaining economically vital city neighborhoods.

## NSA Change 2000-2002

A review of the analytical results from the 2000 Quality of Life Study compared with the 2002 findings shows continued improvement in the overall neighborhood scale quality of life in Charlotte. However, not all neighborhoods are improving their quality of life at the same speed. As in any dynamic urban environment, the rate of community change is uneven with some neighborhoods making rapid progress and others showing slower improvement. Within the methodological framework of this study, there are selected NSAs lagging behind the citywide mean and, therefore, present signs for increased risk of neighborhood decline.

Figure 15 presents the quality of life index results for 2000 and 2002. These data show that in 2000 there were 99 NSAs that were classified as stable, 44 were classified as threatened, and 30 were classified as fragile. In 2002, the number of stable NSAs grew to 100, while the number of threatened NSAs has dropped to 41. The number of fragile NSAs grew to 32.

Geographically, fragile NSAs continue to be concentrated in inner city, arching in a southwest to northeast band around central city Charlotte. Threatened communities are similarly distributed in portions of the city north, south and west of central city. Former aggregations of threatened NSAs in west and south Charlotte have expanded since 2000. Stable NSAs continue to be heavily concentrated in suburban districts especially the southeastern quadrant of the city.

## Neighborhood Profiles

## **Neighborhood Profiles**

The following section presents a quality of life profile for each of the 173 NSAs in this report. The profile is intended to provide a “snapshot” of each community as well as a perspective on how an NSA stands in comparison to citywide averages. Each Individual profile contains:

- Cumulative quality of life rating;
- Quality of life rating for each dimension (Social, Crime, Physical, Economic);
- Statistical background data on the NSA;
- NSA location map;
- Individual neighborhood data for each of the 19 variables used in the analysis with comparable citywide data for the same variables. In cases where citywide data could not be calculated or were inappropriate, values were not provided;

The detailed statistical data that are used to compile this profile are described in Appendix B of this report. A complete reporting of all of these data by all NSAs are contained in the technical document that accompanies this report.

Appendix B  
Neighborhood Profiles: User Guide

## **Neighborhood Profiles: User Guide**

The following section presents a detailed description of each of the data contained in the neighborhood quality of life analysis and the statistical background data. When variables were calculated or aggregated these processes are explained. In addition, the primary sources for each data unit are presented.

## Statistical Background Data

**Population** - The total population of the neighborhood was calculated from Census Block statistics.

Source: United States Census Bureau, 2000.

**Youth Population** - Youth population of the neighborhood was calculated from Census Block statistics.

Source: United States Census Bureau, 2000.

**Number of Housing Units** - The number of housing units was calculated from a digital coverage of the tax parcel file. Each parcel contains the number of housing units and was aggregated for each neighborhood.

Source: Charlotte Mecklenburg County GIS Department, 2001.

**Area (Acres)** - The area of the neighborhoods was calculated using GIS software.

Source: Charlotte-Mecklenburg Planning Commission, 1999.

**Median Household Income** - The median household income was calculated from Census Block Group statistics. Another widely used benchmark for income is the HUD median family income. The HUD income is \$64,100. It covers the larger seven county Charlotte MSA.

Source: Claritas Core Trendline Data for all Block Groups in Mecklenburg County, NC, 2001.

**Average House Value** - The 1998 appraised value for single-family homes, condominiums, and townhouses were averaged for each neighborhood from a digital coverage of the tax parcel file. A house value change was calculated based on 2000 and 2001 sale prices and the 1998 average house value. An average of the house value change for each neighborhood was used to calculate the average house value.

Source: Mecklenburg County GIS Department, 2001.

**Neighborhood Organizations** – The total number of neighborhood organizations for each neighborhood was identified.

All neighborhood organizations on record were address matched using GIS. The point data were identified with neighborhood boundaries. The total number of neighborhood organizations was aggregated for each neighborhood.

Source: Charlotte Mecklenburg Planning Commission, 2001.

**Unemployment Index** – For each zip code in Charlotte, the number of people applying for unemployment benefits were totaled for the months of January 2001 through June 2001. This total was divided by the number of persons able to work. The resulting number was indexed based on the following:

0 – 1.5%	Low
1.5% - 2.25%	Medium
2.25% - 4.25%	High

The resulting index was assigned to each neighborhood that fell in the respective zip code's boundary.

Source: Employment Security Commission of North Carolina, 2001.

**Neighborhood Investment** – Using the tax parcel database, all parcels showing new building activity in 1999 and 2000 were selected. The total improvement value for each parcel was summed by neighborhood and divided by the area to obtain the total investment per square mile. This resulting number was then divided by 2 to obtain the investment per square mile per year.

Source: Mecklenburg County GIS Department, 2001.

## **Social Dimension**

**Percent of Persons over Age 64** - The proportion of the population that is 65 years and older represents the Aged Dependency Ratio.

The total number of people 65 years and older and the total overall population were calculated from Census Block Statistics for each neighborhood.

The Aged Dependency Ratio is equal to the total number of aged persons 65 years and older divided by the total population for each neighborhood.

Source: U.S. Census Bureau, 2000.

**Average Kindergarten Score** – An average achievement score was calculated for each kindergarten student at the end of the year. These achievement scores were averaged from math and verbal scores.

All kindergarten students were address-matched using GIS. The point data were identified with neighborhood boundaries. The achievement scores for all kindergarten students were averaged to get an average end-of-year kindergarten achievement score for each neighborhood.

Source: Charlotte-Mecklenburg Schools System, 2001.

**Dropout Rate** – Percentage of high school students who dropped out of school

All high school students at the end of the year 2001 were address-matched using GIS. The point data were then identified with the neighborhood boundaries to get the total number of high school students per neighborhood.

From the total number of high school students, students who dropped out were identified. The total number of high school students who dropped out was then divided by the total number of high school students to get the percentage of high school students who dropped out.

Source: Charlotte-Mecklenburg School System, 2001.

**Percent of Children Passing Competency Exams** – Percentage of ninth grade students that passed the required competency exams.

All students who completed the ninth grade as of 2001 were address-matched using GIS. The point data were then identified with the neighborhood boundaries to get the total number of ninth grade students for each neighborhood.

From the total number of ninth grade students, students who passed required competency exams were identified. Total number of ninth grade students who passed was then divided by the total number of ninth grade students to get the percentage of ninth grade students who passed the required competency exams.

Source: Charlotte-Mecklenburg School System, 2001.

**Percent of Births to Adolescents** - Percent of children born in 2000 to women 18 years and younger.

All 2000 birth records for Mecklenburg County were address-matched using GIS. The point data were then identified with the neighborhood boundaries to get a total number of births for each neighborhood.

From the total number of births, births to adolescents were identified. Total births to adolescents were then divided by the total births to get the percentage of total children born to women 18 years and younger for each neighborhood.

Sources: Mecklenburg County Health Department, Birth Certificate Data, 2000.

**Youth Opportunity Index** - A measure of the potential opportunities for youth to get involved in extra-curricular activities within the neighborhood.

“Opportunities” were defined as locations within the community that offered programs and activities for youth up to age 18. Locations included YMCA/YWCAs, churches, schools (offering before and/or after school programs), recreation centers, community centers and libraries. Opportunity locations were scored as follows:

- Churches—Because churches provide services beyond their neighborhood boundaries, each church was buffered by a ¼-mile ring that was considered to be a reasonable walking distance for youth to utilize the services offered by the church. Each church was given a score of 1, which was a minimal score that identified the church as a potential activity center. Each residential unit captured by the buffer zone was assigned a score of 1.
- Schools—Schools were given a score of 1 for a before-school program and a score of 1 for an after-school program. The highest score possible for a single school was 2 for having both programs in place. Because these schools provided services beyond their neighborhood boundaries, each school was buffered by a ¼-mile ring that was considered to be a reasonable walking distance for youth to utilize the services offered by the school. Each residential unit captured by the buffer zone was assigned a score of based on the programs provided by the adjacent school
- Recreation Centers, Community Centers and YWCA/YMCAs—Because these centers provide services beyond their neighborhood boundaries, each center was buffered by a ¼-mile ring that was considered to be a reasonable walking distance for youth to utilize the services offered by the center. Each center was given a score of 3, which was assigned to every residential unit within the buffer zone.
- Libraries—Libraries were scored using the same methodology as the Centers except that a library was given a score of 2, indicating that it potentially offered greater services than a church but fewer than a Recreation Centers, Community Centers or YWCA/YMCAs. Each residential unit that fell in the buffer zone was assigned a score of 2.

Each residential unit within a neighborhood had the potential of receiving a score ranging from 0 to 9. The score for each neighborhood was calculated based the average youth opportunity score for each residential unit. This composite score represents the total number and types of opportunities available to youth.

0.0 - 0.09	<i>Low Youth Opportunity</i>
0.09 - 0.90	<i>Medium Youth Opportunity</i>
0.90+	<i>High Youth Opportunity</i>

Source: Charlotte Area YMCAs, 2001.  
Charlotte Area YWCAs, 2001.  
Charlotte-Mecklenburg Library System, 2001.  
Charlotte-Mecklenburg Park and Recreation Department, 2001.  
Charlotte-Mecklenburg Schools, 2001.

## Crime Dimension

**Violent Crime Rate** - The rate of violent crime in each neighborhood as compared with the rate of violent crime in the City of Charlotte.

The locations of violent crime offenses in 2000 were address-matched using GIS. For the purpose of this study, violent crimes include homicides, rapes, robberies, and aggravated assaults defined according to UCR (Uniform Crime Report) standards. The point data were then intersected with all neighborhoods to get the total number of crimes per neighborhood. The total number of violent crimes was also summed for the City of Charlotte.

The population of each neighborhood and the City of Charlotte was calculated from Census Block statistics. The number of violent crime incidents for each neighborhood was divided by the population of each neighborhood to get the rate of violent crime. The total number of violent crime incidents for the City of Charlotte was divided by the population of Charlotte to get the rate of violent crime. The rate of violent crime per population for each neighborhood was then compared to the rate of violent crime per population for the city.

The Location Quotient method was used for the comparison. The results indicate the share of all violent crime in the City of Charlotte captured by the individual neighborhood. For instance, a score of 2.00 indicates that the particular neighborhood has a rate of violent crime that is twice the rate of violent crime in the city.

Sources: Charlotte-Mecklenburg Police Department, Research and Planning Department, 2000.

**Juvenile Arrest Rate** - The rate of juvenile arrests in each neighborhood as compared with the rate of juvenile arrests in the City of Charlotte.

The locations of juvenile arrests in 2000 were address-matched using GIS. For the purpose of this study, juvenile arrests are based on individuals arrested under the age of 16. This definition is based on North Carolina state statutes which generally define a juvenile offender according to this age definition. The point data were then intersected with all neighborhoods to get the total number of arrests per neighborhood. The total number of juvenile arrests was also summed for the City of Charlotte.

The juvenile population of each neighborhood and the City of Charlotte was calculated from Census Block statistics. The number of juvenile arrest incidents for each neighborhood was divided by the juvenile population of each neighborhood to get the rate of juvenile arrests. The total number of juvenile arrests incidents for the City of Charlotte was divided by the juvenile population of Charlotte to get the rate of juvenile arrests. The rate of juvenile arrest per population for each neighborhood was then compared to the rate of juvenile arrests per population for the city.

The Location Quotient method was used for the comparison. The results indicate the share of all juvenile arrests in the City of Charlotte captured by the individual neighborhood. For instance, a score of 2.00 indicates that the particular neighborhood has a rate of juvenile arrests that is twice the rate of juvenile arrests in the city.

Sources: Charlotte-Mecklenburg Police Department, Research and Planning Department, 2000.

**Property Crime Rate** - The rate of property crime in each neighborhood as compared with the rate of property crime in the City of Charlotte.

The locations of property crime offenses in 2000 were address-matched using GIS. For the purpose of this study, property crimes include burglaries, larcenies, vehicle thefts, arsons, and vandalisms defined according to UCR (Uniform Crime Report) standards. The point data were then intersected with all neighborhoods to get the total number of crimes per neighborhood. The total number of property crimes was also summed for the City of Charlotte.

The population of each neighborhood and the City of Charlotte was calculated from Census Block statistics. The number of property crime incidents for each neighborhood was divided by the population of each neighborhood to get the rate of property crime. The total number of property crime incidents for the City of Charlotte was divided by the population of Charlotte to get the rate of property crime. The rate of property crime per population for each neighborhood was then compared to the rate of property crime per population for the city.

The Location Quotient method was used for the comparison. The results indicate the share of all property crime in the City of Charlotte captured by the individual neighborhood. For instance, a score of 2.00 indicates that the particular neighborhood has a rate of property crime that is twice the rate of property crime in the city.

Sources: Charlotte-Mecklenburg Police Department, Research and Planning Department, 2000.

**Crime Hot Spots** - Areas in neighborhoods that have high concentration of violent crime, defined using GIS Grid applications.

The locations of monthly violent crime offenses for 2000 were address-matched using GIS. For the purpose of this study, the crimes compiled in the hotspot analysis were violent crimes including homicides, rapes, robberies, and aggravated assaults defined according to Part I and Part II offense categories as defined by Uniform Crime Reporting standards with the inclusion of missing persons and hit-and-runs. A density grid was created from the violent crime data using a 250' cell size, a 1500' search radius, and the kernel method. Cells with a density greater than 3 standard deviations above the mean of the grid were considered hot cells. Locations with 5 or more overlapping, monthly hotspots were considered durable hotspots and flagged to be included to calculate final hotspot values for each NSA.

The total number of durable hot cells was divided by the total number of cells for each neighborhood to get the proportion of a neighborhood that is considered a durable violent crime hotspot. For instance, a score of 0.9 indicates that 90% of the particular neighborhood is covered by a durable violent crime hotspot.

Source: Charlotte-Mecklenburg Police Department, Research and Planning Department, 2000.

## Physical Dimension

**Appearance Index** – A sample was taken of all the appearance code violations in Mecklenburg County.

The sample consisted of ten percent of violations recorded from April 2000 to March 2001. The sample records were then address-matched with GIS. This point data were identified with neighborhood boundaries to get the total number of sampled appearance code violations for each neighborhood. The sample number was then multiplied by 10 and then divided by the total number of parcels in the neighborhood. The results were indexed as followed:

0 – 0.34	Low
0.34 – 0.759	Medium
0.759 – 2.571	High

Source: Charlotte Solid Waste Services, 2000-2001.

**Percent Substandard Housing** - Percent of housing units in a neighborhood rated as deteriorated or dilapidated by the Charlotte Housing Survey.

Records of all houses surveyed were address-matched using GIS. The point data were then intersected with all neighborhoods to get the total number of surveys for each neighborhood.

For each record, deteriorated or dilapidated houses were identified. The total number of deteriorated dilapidated houses surveyed in each neighborhood were then divided by the total number of surveys in each neighborhood to get the percentage of substandard housing.

Source: *Housing Quality in the City of Charlotte* Report, 2001.

**Home Ownership** - Percentage of all residential units that were owner-occupied in 2000.

By utilizing the tax parcel database, each tax record was assigned to a neighborhood using GIS. Each tax record was analyzed for residential use and owner occupancy. The records were summarized for each neighborhood by residential units.

From each neighborhood, the number of owner-occupied units and total occupied units were calculated. The owner-occupied units were divided by the total occupied-units to get the percent of home ownership for each neighborhood.

Source: Mecklenburg County GIS Department, 2000.

**Projected Infrastructure Improvement Costs** – An estimate of construction costs for sidewalk, curb, and minor drainage only, not including any funds for the repair or installation of major drainage systems. Estimates are for each neighborhood.

The total area of the neighborhood is calculated in square miles. The estimated construction costs were divided by the total area to get the infrastructure cost per square mile for each neighborhood.

Source: Charlotte Engineering and Building Maintenance Department Assessments, 2001.

**Percent of Persons with Access to Public Transportation** – The percentage of neighborhood residents who live within walking distance of public transportation, defined using the Charlotte Area Transit System bus stops.

By utilizing the tax parcel database, each tax record was assigned to a neighborhood using GIS. Each tax record was analyzed for residential use and the total number of residential units was calculated for each neighborhood.

The bus stops were buffered by  $\frac{1}{4}$  mile using GIS. The tax parcels that fell within the buffer boundaries were used to calculate the number of residential units accessible to public transportation. The number of residential units accessible to public transportation was divided by the total number of residential units to get the percentage of residents accessible to public transportation for each neighborhood.

Source: Charlotte Area Transit System, 2000.

**Percent of Persons with Access to Basic Retail Facilities** – The percentage of neighborhood residents that are within walking distance to a grocery store and/or a pharmacy.

By utilizing the tax parcel database, each tax record was assigned to a neighborhood using GIS. Each tax record was analyzed for residential use and the total number of residential units was calculated for each neighborhood.

Grocery stores and pharmacy addresses were address matched in GIS and buffered by  $\frac{1}{4}$  mile. The tax parcels that fell within the buffer boundaries were used to calculate the number of residential units accessible to basic retail. The number of residential units accessible to basic retail was divided by the total number of residential units to get the percentage of residents accessible to basic retail for each neighborhood.

Sources: Mecklenburg County GIS.  
BellSouth Yellow Pages, Charlotte, 2001.

**Pedestrian Friendliness Index** – An index of pedestrian friendliness based on the total length of sidewalks in each neighborhood as compared to the total length of the streets. Index values could rank from 0-2.0. The index score were scaled using the following qualitative ranking.

- 0.0 - 1.0 Low Pedestrian Friendliness
- 1.1 - 1.3 Medium Pedestrian Friendliness
- 1.4 + High Pedestrian Friendliness

Source: Charlotte Department of Transportation, 1997.

## **Economic Dimension**

**Percent of Persons Receiving Food Stamps** - The percent of people in a neighborhood who were receiving Food Stamps as of July 2001.

All individual records of people receiving food stamps were address-matched using GIS. The point data were then identified with all the neighborhoods to get the total number of people receiving foods stamps in each neighborhood.

The total population of the neighborhood was calculated from Census Block statistics. The total number of people receiving food stamps was then divided by the total population to get the percentage of total people receiving food stamps for each neighborhood.

Sources: Mecklenburg County Department of Social Service Office of Planning and Evaluation, 2001.

**Percent Change in Income** – Percent increase or decrease in median household income from 1990 to 2001. The following equation was used:

$$\frac{2001 \text{ income} - 1990 \text{ income}}{1990 \text{ income}} * 100 = \% \text{ Change in Income}$$

Source: Claritas Core Trendline Data for all Block Groups in Mecklenburg County, NC, 2001.

## CWAC Analysis

## CWAC Neighborhoods

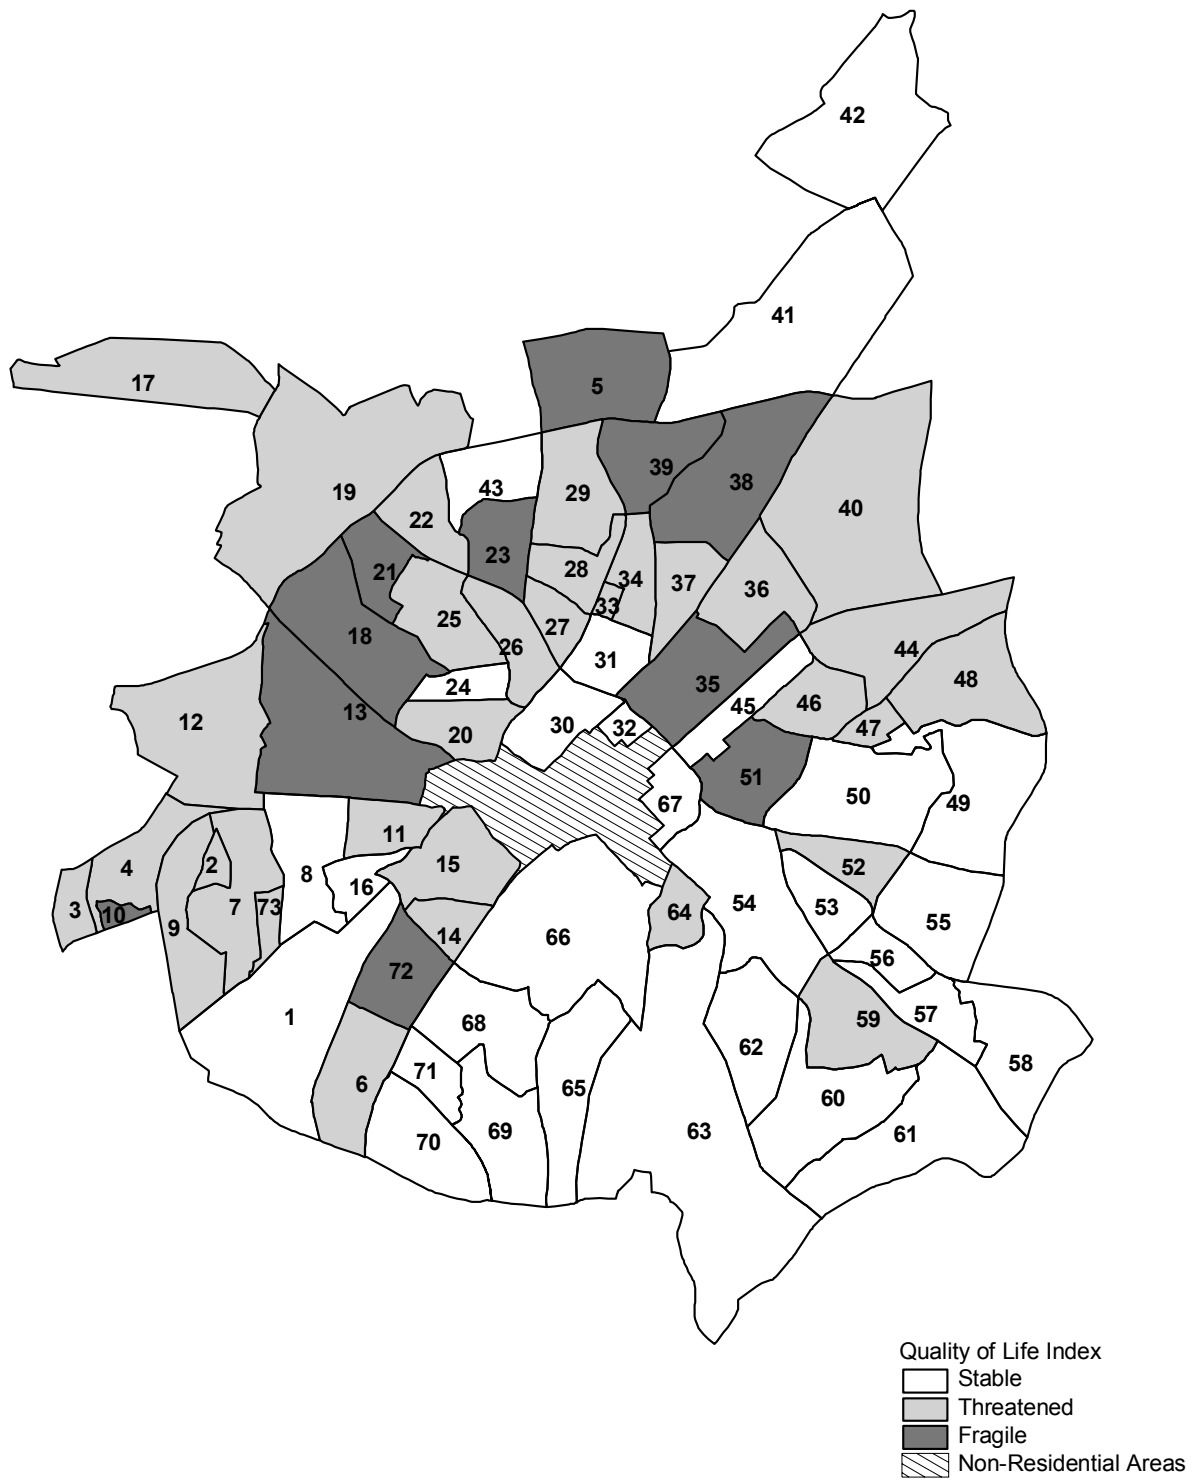

Earlier quality of life studies were focused exclusively on the 73 City Within a City (CWAC) neighborhoods. As a consequence the quality of life indices that were calculated did not include wealthier, more suburban communities.

Beginning in 1998, the CWAC geography was replaced by the larger, more comprehensive neighborhood statistical area (NSA) framework. Within this framework, all analyses of neighborhood quality of life were structured to reflect citywide measurement rather than inner city or suburban boundaries.

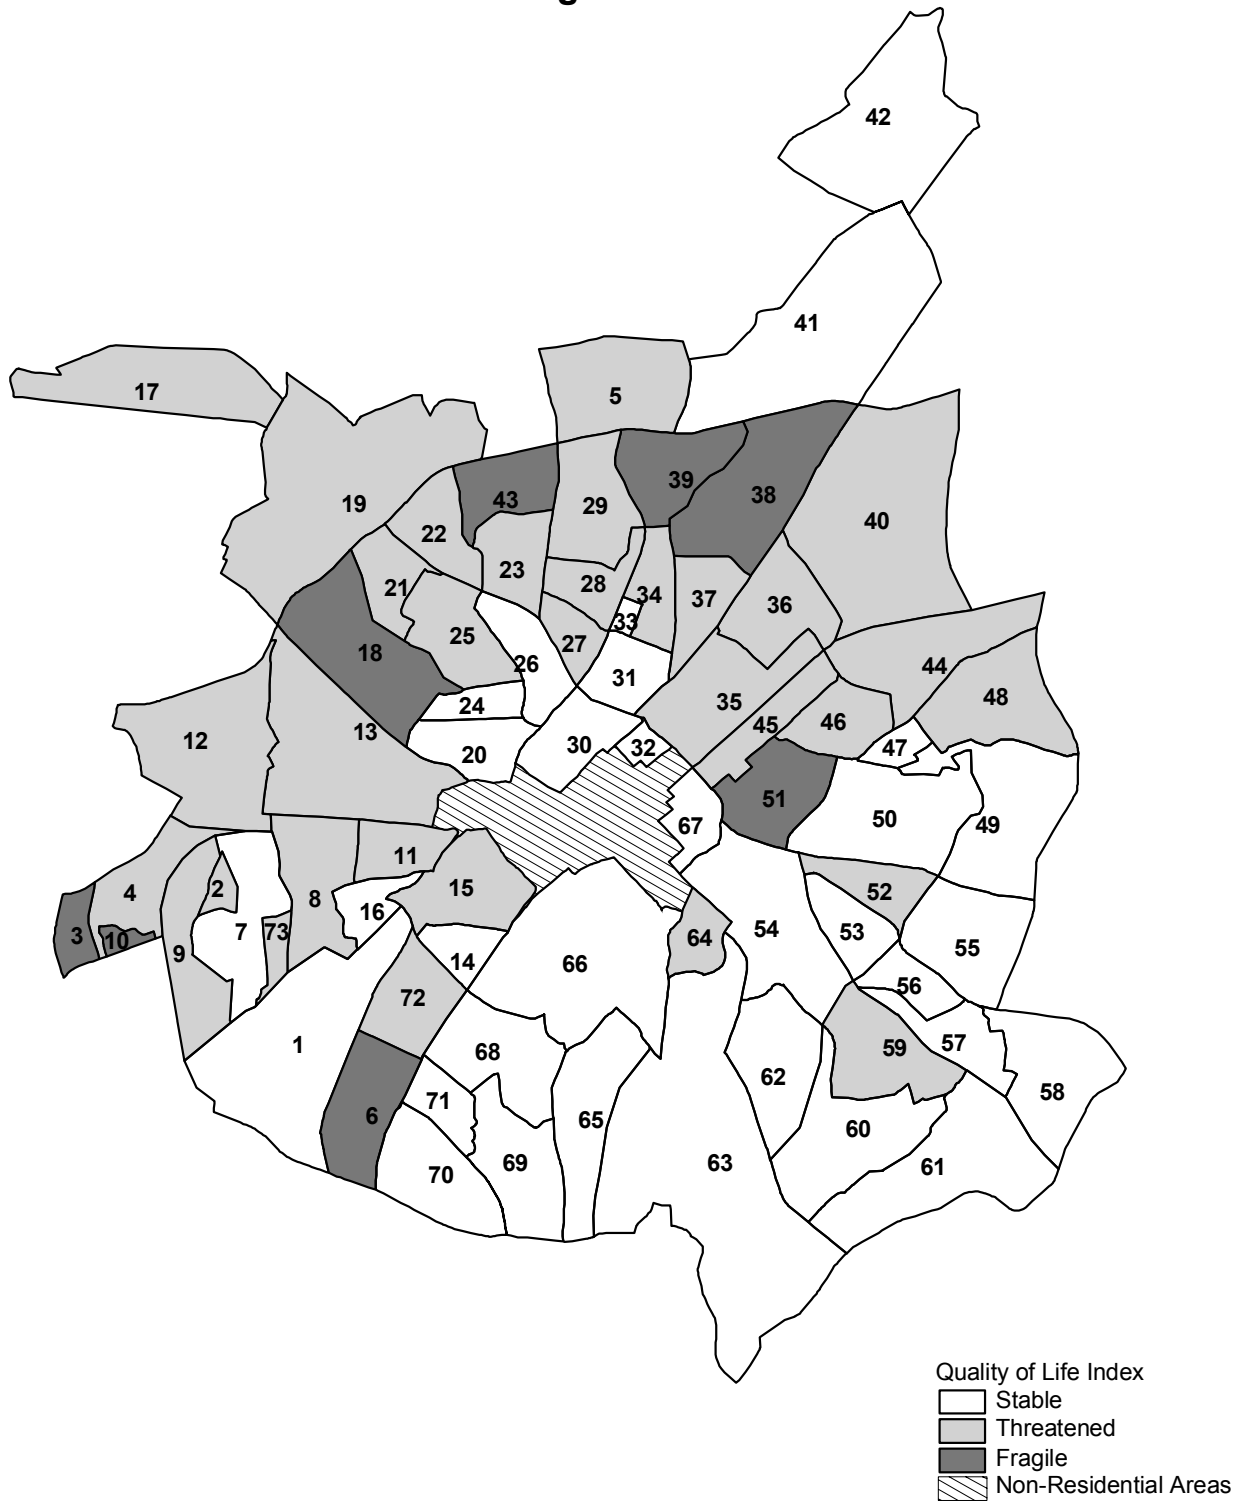

Nonetheless, it is useful to provide a longitudinal perspective on neighborhood change in CWAC. Accordingly, a separate statistical analysis was performed on the CWAC communities. These findings are presented in the following two maps and table.

A review of the 2002 data show that the number of stable communities within CWAC has grown significantly, from 24 in 1997 to 33 in 2002. Conversely, there has been a decline in fragile neighborhoods from 15 to 8. Although the number and composition of the quality of variables has changed between the 1997 and 2002, thus making direct comparison impossible, the strategic shift to stable neighborhoods supports the conclusion that CWAC neighborhoods are making substantial strides in community quality of life. Figure 1 shows the CWAC only analysis results for 2000. Figure 2 and Table 2 show the CWAC only results for 2002.
